Railings

for every application

Our residential rails are custom fabricated to meet the need of the builder, architect or homeowner. We offer a large selection of designs, that can be found on our website, at seoic.com. However, we are not restricted to only those designs shown in our galleries and can produce any design, provided by the homeowner, builder or architect.

Our commercial railings are code compliant and exceed the load requirement capacity. We are Auto Cad capable and work closely with Architects and General Contractors to ensure a seamless project from start to finish. We provide railings and grilles, for every application such as, educational, multi-family, high rise, club houses, offices, hotels, public parking garages etc.

We design and build self supporting balcony systems for customers with an "after thought" as well as for builders and architects to help reduce the overall cost that is associated with the construction of a balcony structure.

Cable railing systems are growing in popularity because they offer customers a less obstructed view from their balcony, deck, or loft. We use the Invisiwire cable system so that our cable tensioning hardware is hidden in the posts. All cable are 316 stainless steel. The frame of the cable rail system can be provided in Stainless Steel, Aluminum or Steel. Sizes and shapes may vary in accordance to customer's preference, within the required parameters
